

BEACH BEAN

Canavalia rosea (formerly *maritima*)

Fabaceae

ECHO® PLANT INFORMATION SHEET

ဖော်ပြချက်

Canavalia rosea is a leguminous, drought and salt tolerant vine adapted to growing under very dry and hot conditions. Vines are widely distributed on beaches and dunes in the tropics and subtropics, also western and northern Australia. They can reach lengths of 6 m, with a compact canopy 15-30 cm high. Flat, woody pods filled with seeds are 10-15 cm long.

အသုံးပြုခြင်း

C. rosea is cultivated as a green manure cover crop, or as a forage crop for cattle. Its long taproot, habit of rooting at each node, and fast growth make it a good choice for eroded, sandy soils.

အများသုံးအမည်များ

- English
 - Bay Bean
 - Mackenzie Bean
 - Seaside jack bean
 - Coastal Jack Bean
- Spanish
 - frijolillo
 - haba poroto de playa
 - mate de costa

ပျိုးထောင်ခြင်း

- **Elevation** - unclear
- **Rainfall**- drought-tolerant; tolerates high humidity
- **Soil Types** - sandy, rocky soils that are well-drained; acid or slightly alkaline.
- **Temperature Range** - unclear
- **DeLength Sensitivity** – unclear
- **Light** – prefers full sun

ရိတ်သိမ်းခြင်းနှင့်ပျိုးစေ့ထုတ်လုပ်ခြင်း

Seeds germinate easily if the seed coat is punctured or nicked to allow water absorption and gas exchange (scarification). Cuttings root rapidly when a stem tip with at least two nodes is used. New growth can reach 1.2–1.5 m in 2-3 weeks. Pods should be allowed to dry on the plant. They will split open (dehisce) when seeds are ready to be harvested.

သီးနှံဖျက်ပိုးများနှင့်ရောဂါများ

No serious pests or diseases known.

ချက်ပြုတ်ခြင်းနှင့်အဟာရ

Not for human consumption.
